

Automated Event Service (AES): Efficient and Flexible Searching for Earth Science Phenomena

PI: Thomas Clune, NASA GSFC

Objective

Develop an Automated Event Service system that:

- Methodically mines custom-defined events (e.g., tornadoes) in the reanalysis data sets of global atmospheric models.
- Enables researchers to specify their custom, numeric event criteria using a user-friendly web interface to search the reanalysis data sets.
- Supports Event Specification Language (ESL) for more flexibility and versatility.
- Contains a social component that enables the dynamic formation of collaboration groups for researchers to cooperate on event definitions of common interest.
- Provides rapid results via high performance computing and advanced search technologies.

Overview of AES

Accomplishments

- Demonstrated ability to identify events in MERRA data using user-defined criteria within SciDB. Use case demonstrated include:
 - Blizzard use case
 - Somali Jet stream use case
- Demonstrated ability to characterize events and compute event statistics
- Demonstrated web services layer that could be used to embed AES in other systems
- Demonstrated ability to link AES events with Earth Observing System (EOS) Clearing House (ECHO) searches for relevant remote sensing data
